

Hi!

Congratulations on your new Spruce Effects pedal! We work hard to make sure everything is right on your pedal, so let us know if you have any questions at info@spruceeffects.com. Oh, all of our effects take center negative, standard 2.1mm power supplies. We recommend using a high quality, isolated power source built for guitar effects. Thanks again and have fun!

Sincerely,
Brian and Katie
Founders, Spruce Effects

Salt Water Fuzz

This wild Germanium fuzz effect is extremely well suited to hot lead licks or heavy fuzz chords. The controls are extremely varied and dynamic, so lowering will influence the way the other 2 controls are set. This allows for a nearly infinite range of tones. Try dropping the Surf control while increasing Swell to see how Tide reacts. Experiment with all three controls to find that super-smooth setting for your particular rig.

Controls

Swell: Controls the amount of volume coming from the effect.

Surf: Controls the amount of fuzz coming from the effect. Fuzz is available even when this control is counter-clockwise, allowing you to dial in more volume and control using your guitar volume.

Tide: Controls the tone of the signal. More low end is counter-clockwise while more high end is clockwise.
